DETAILED ACTION

Allowable Subject Matter

1. Claims 1, 3-6, 8-9, 11-15 and 17-20 are allowed.

The following is an examiner's statement of reasons for allowed:

Regarding claim 1, the prior art of records teach a method of limiting communication access between wireless Local Area Network (LAN) terminals of a wireless LAN, said wireless LAN terminals comprising a first wireless LAN terminal and a second wireless LAN terminal, the first wireless LAN terminal and the second wireless LAN terminal being wirelessly connected, comprising: allocating different subnetwork addresses to respective wireless LAN terminals in a wireless LAN access point; setting default gateways of the respective wireless LAN terminals as a single access limiter; and returning a communication packet between the wireless LAN terminals from said access limiter which is set as said default gateways, for providing an access limiting function to limit communication access between the wireless LAN terminals.

However, the references found, taken either alone or in combination, fail to teach or suggest *wherein said access limiter comprises two LAN interfaces connected respectively to a wired terminal and said wireless LAN access point said wireless LAN terminals being, connected to said wireless LAN access point, said access limiter comprising: an access limiting function for passing or dropping a received packet to thereby inhibit or permit communications between the terminals a band limiting function for buffering a received packet to process audio packets with priority over other packets a routing function for distributing packets selectively to said wired terminal and said wireless LAN access point*

Art Unit: 2617

depending on a destination of the packets a Dynamic Host Configuration Protocol (DHCP) server for allocating IP addresses having different subnets for the respective terminals in response to DHCP requests from said wired LAN terminals; and an Address Resolution Protocol (ARP) server installed in an existing IP protocol stack.

Therefore the Examiner allows these limitations in combination with other features recited with in claim. Claims 3-6 and 8 are allowed because the claims are dependent directly or indirectly on claim 1.

Regarding claim 9, the prior art of records teach a wireless LAN system, comprising: a wireless LAN access point configured to wirelessly associate with a plurality of wireless terminals, said plurality of wireless terminals being wirelessly connected; an access limiter configured to control communications between a first of the plurality of the wireless terminals and a second of the plurality of the wireless terminals at the wireless LAN access point.

However, the references found, taken either alone or in combination, fail to teach or suggest *a band limiter to buffer a received packet to process audio packets with priority over other packets; a router to distribute packets selectively to said wired terminal and said wireless LAN access point depending on a destination of the packets; a Dynamic Host Configuration Protocol (DHCP) server for allocating IP addresses having different subnets for the respective terminals in response to DHCP requests from said wired LAN terminals; and an Address Resolution Protocol (ARP) server installed in an existing IP protocol stack, wherein the first wireless terminal and the second wireless terminal communicate through the access limiter,*

Art Unit: 2617

and wherein each of the first wireless terminal and the second wireless terminal are allocated different subnetwork addresses.

Therefore the Examiner allows these limitations in combination with other features recited with in claim. Claims 11-15 and 20 are allowed because the claims are dependent directly or indirectly on claim 9.

Regarding claim 17, the prior art of records teach a wireless network router, comprising: a wireless access point; and an access limiter comprising a plurality of Local Address Network (LAN) interfaces associated to the wireless access point, the access limiter comprising: an access limiting apparatus to pass or drop a received packet to thereby inhibit or permit communications between a plurality of wireless terminals, said plurality of wireless terminals being wirelessly connected; a routing apparatus for distributing packets selectively between the wireless LAN access point depending on a destination of the packets between the plurality of wireless terminals.

However, the references found, taken either alone or in combination, fail to teach or suggest ***a band limiter to buffer a received packet to process audio packets with priority over other packets; a router to distribute packets selectively to said wired terminal and said wireless LAN access point depending on a destination of the packets; a Dynamic Host Configuration Protocol (DHCP) server for allocating IP addresses having different subnets for the respective terminals in response to DHCP requests from said wired LAN terminals; and an Address Resolution Protocol (ARP) server installed in an existing IP protocol stack, wherein communication between any of the plurality of wireless terminals is routed***

Art Unit: 2617

through the access limiter, and wherein each of the wireless terminals is allocated a different subnetwork address.

Therefore the Examiner allows these limitations in combination with other features recited with in claim. Claims 18-19 are allowed because the claims are dependent directly or indirectly on claim 17.

2. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submission should be clearly labeled "Comments on Statement of Reasons for Allowance."
